

Deep Learning

Chapter 3 Convolutional Neural Network

Dr. Van-Toi NGUYEN

EEE, Phenikaa University

Chapter 3: Convolutional Neural Network

1. Convolutional operator
2. History of CNN
3. Deep Convolutional Models
4. Layers in CNN
5. Applications of CNN
6. Practice

3.1 Convolutional Operator

The general form for matrix convolution is

$$\begin{bmatrix} x_{11} & x_{12} & \cdots & x_{1n} \\ x_{21} & x_{22} & \cdots & x_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ x_{m1} & x_{m2} & \cdots & x_{mn} \end{bmatrix} * \begin{bmatrix} y_{11} & y_{12} & \cdots & y_{1n} \\ y_{21} & y_{22} & \cdots & y_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ y_{m1} & y_{m2} & \cdots & y_{mn} \end{bmatrix} = \sum_{i=0}^{m-1} \sum_{j=0}^{n-1} x_{(m-i)(n-j)} y_{(1+i)(1+j)}$$

3.4 Convolutional layer

Convolutional layer (Conv)

3.4 Convolutional layer

Padding

Size of input data: $n \times n$, Size of filter: $f \times f$
Size of output: $(n - f + 1) \times (n - f + 1)$
Example: $6 - 3 + 1 = 4$, hence 4×4 , size is reduced!

Use padding, extra border of 1 all around, ($p = 1$) gives output of
 $(n + 2p - f + 1) \times (n + 2p - f + 1) = 6 \times 6$ (same as original data size)

Padding

- “**Valid**” (no padding): $n \times n * f \times f \rightarrow (n - f + 1) \times (n - f + 1)$
 - $6 \times 6 * 3 \times 3 \rightarrow 4 \times 4$
- “**Same**”: Pad so that output size is the same as the input size
 - $n + 2p - f + 1 = n \Rightarrow p = \frac{f-1}{2}$
 - $f = 3, p = \frac{3-1}{2} = 1$, or $f = 5, p = 2$

3.4 Convolutional layer

Stride

2	3	3	4	7	3	4	4	6	3	2	4	9	4
6	1	6	0	9	1	8	0	7	1	4	0	3	2
3	3	4	4	8	3	3	4	8	3	9	4	7	4
7	1	8	0	3	1	6	0	6	1	3	0	4	2
4	3	2	4	1	3	8	4	3	3	4	4	6	4
3	1	2	0	4	1	1	0	9	1	8	0	3	2
0	-1	1	0	3	-1	9	0	2	-1	1	0	4	3

7 x 7

$$\begin{matrix} * & \begin{matrix} \begin{matrix} 3 & 4 & 4 \\ 1 & 0 & 2 \\ -1 & 0 & 3 \end{matrix} \\ \end{matrix} & = & \begin{matrix} \begin{matrix} 91 & 100 & 83 \\ 69 & 91 & 127 \\ 44 & 71 & 74 \end{matrix} \end{matrix} \end{matrix}$$

3 x 3

Stride = 2

$$n \times n * f \times f \text{ (padding } p, \text{ stride } s) \Rightarrow \left\lfloor \frac{n + 2p - f}{s} + 1 \right\rfloor \times \left\lfloor \frac{n + 2p - f}{s} + 1 \right\rfloor$$
$$(7 + 0 - 3)/2 + 1 = 4/2 + 1 = 3$$

3.4 Convolutional layer

Multiple Filter (Convs)

3.4 Convolutional layer

Multiple Filter (Convs)

3.4 Convolutional layer

No. Parameters

- If you have 10 filters that are 3 x 3 x 3 in one layer of a neural network, how many parameters does that layer have?

- $(3 \times 3 \times 3 + 1) \times 10 = 280$ parameters
- No matter how large the input image is, the number of parameters is fixed to 280 for 10 filters of size 3 x 3 x 3.

Summary

If layer 1 is a convolution layer:

Activations: $a^{[l]} \Rightarrow n_H^{[l]} \times n_W^{[l]} \times n_C^{[l]}$

- $f^{[l]} = \text{filter size}$

Weights: $f^{[l]} \times f^{[l]} \times n_C^{[l-1]} \times n_C^{[l]}$

- $p^{[l]} = \text{padding}$

Bias: $n_C^{[l]}$

- $s^{[l]} = \text{stride}$

- $n_C^{[l]} = \text{number of filters}$

- Each filter is: $f^{[l]} \times f^{[l]} \times n_C^{[l-1]}$

- Input Size: $n_H^{[l-1]} \times n_W^{[l-1]} \times n_C^{[l-1]}$

- Output Size: $n_H^{[l]} \times n_W^{[l]} \times n_C^{[l]}$

- $$n_H^{[l]} = \left\lfloor \frac{n_H^{[l-1]} + 2p^{[l]} - f^{[l]}}{s^{[l]}} + 1 \right\rfloor$$

- $$n_W^{[l]} = \left\lfloor \frac{n_W^{[l-1]} + 2p^{[l]} - f^{[l]}}{s^{[l]}} + 1 \right\rfloor$$

Summary

If layer 1 is a convolution layer:

Activations: $a^{[l]} \Rightarrow n_H^{[l]} \times n_W^{[l]} \times n_C^{[l]}$

- $f^{[l]} = \text{filter size}$

Weights: $f^{[l]} \times f^{[l]} \times n_C^{[l-1]} \times n_C^{[l]}$

- $p^{[l]} = \text{padding}$

Bias: $n_C^{[l]}$

- $s^{[l]} = \text{stride}$

- $n_C^{[l]} = \text{number of filters}$

- Each filter is: $f^{[l]} \times f^{[l]} \times n_C^{[l-1]}$

- Input Size: $n_H^{[l-1]} \times n_W^{[l-1]} \times n_C^{[l-1]}$

- Output Size: $n_H^{[l]} \times n_W^{[l]} \times n_C^{[l]}$

- $$n_H^{[l]} = \left\lfloor \frac{n_H^{[l-1]} + 2p^{[l]} - f^{[l]}}{s^{[l]}} + 1 \right\rfloor$$

- $$n_W^{[l]} = \left\lfloor \frac{n_W^{[l-1]} + 2p^{[l]} - f^{[l]}}{s^{[l]}} + 1 \right\rfloor$$

3.4 Max Pooling
